NX7

NX7 series machine controller

Sysmac controller - NX7 series

The NX7 series is a high performance machine controller that includes two synchronized motion cores controlling up to 256 axes.

- Fastest cycle time: 125 µs
- Number of axes: 256, 128
- Two synchronized motion cores
- Functions: Logic sequence and Motion
- Multi-tasking
- Built-in EtherCAT and two EtherNet/IP (1 Gbps) ports
- Fully conforms to IEC 61131-3 standards
- Certified PLCopen function blocks for motion control

System configuration

Specifications

General specifications

Item		NX7 CPU Unit				
Enclosure		Mounted in a panel				
Grounding		Less than 100 Ω				
CPU unit dimensions (H	$\times D \times W$)	100 mm × 100 mm × 132 mm				
Weight		880 g (including end cover)				
Power consumption		40 W (including SD Memory card and end cover)				
Operation environment	Ambient operating temperature	0 to 55℃				
	Ambient operating humidity	10% to 90% (with non condensation)				
	Atmosphere	Must be free from corrosive gases				
	Ambient storage temperature	-25 to 70°C (excluding battery)				
	Altitude	2,000 m or less				
	Pollution degree	2 or less: Conforms to JIS B3502 and IEC 61131-2.				
	Noise immunity	2 kV on power supply line (conforms to IEC 61000-4-4.)				
	Overvoltage category	Category II: Conforms to JIS B3502 and IEC 61131-2				
	EMC immunity level	Zone B				
	Vibration resistance	Conforms to IEC60068-2-6 5 to 8.4 Hz with 3.5 mm amplitude, 8.4 to 150 Hz.				
		Acceleration of 9.8 m/s ² for 100 min in X, Y and Z directions (10 sweeps of 10 min each = 100 min total)				
	Shock resistance	Conforms to IEC60068-2-27				
		147 m/s ² , 3 times in X, Y and Z directions (100 m/s ² for relay output units)				
Battery	Life	2.5 years (at 25°C, power ON time rate 0% (power OFF))				
	Model	CJ1W-BAT01				
Applicable standards		Conforms to cULus, NK, LR, EC directives, RCM and KC registration.

				At ambient temperature of 25°C: -1.5 to +1.5 min error per month		
1				At ambient temperature of 0° C: -3 to +1 min error per month		

 ^{*1} This is the capacity for the execution objects and variable tables (including variable names).
 ^{*2} This is the total number of axes that are set as servo axes or encoder axes and are also set as used axes.
 ^{*3} This is the total for all axis types.
 ^{*4} Data is updated on the line in the specified interval regardless of the number of nodes.
 ^{*5} Means packets per second, i.e., the number of communication packets that can be sent or received in one second.
 ^{*6} An IGMP client is mounted for the EtherNet/IP port. If an Ethernet switch that supports IGMP snooping is used, filtering of unnecessary multicast packets is performed. formed.

Function specifications

Item				NX7 CPU Unit
Tasks	Function	Function		I/O refreshing and the user program are executed in units that are called tasks. Tasks are used to specify execution conditions and execution priority.
		Periodically exe	ecuted tasks	Maximum number of primary periodic tasks: 1 Maximum number of periodic tasks: 4
		Conditionally e	executed tasks	Maximum number of even tasks: 32 When active even task instruction is executed or when condition expression for variable is met.
Programming	POUs	Programs		POUs that are assigned to tasks.
	(program	Function block	\$	POUs that are used to create objects with specific conditions
	organization	Functions	5	POUs that are used to create an object that determine unique outputs for the inputs, such as
	units)	-		for data processing.
	Programming languages	Types		Ladder diagrams ' and structured text (ST).
	Namespaces			A concept that is used to group identifiers for POU definitions.
	Variables	External access	s of variables	Network variables (the function which allows access from the HMI, host computers or other controllers)
	Data types	Basic data type	9S	BOOL, BYTE, WORD, DWORD, LWORD, INT, SINT, DINT, LINT, UINT, USINT, UDINT, ULINT, REAL, LREAL, TIME (durations), DATE, TIME_OF_DAY, DATE_AND_TIME and STRING (text strings)
		Derivative data	types	Structures, unions, enumerations
		Structures	Function	A derivative data type that groups together data with different variable types. Number of members: 2,048 max.
				Nesting levels: 8 max.
			Member data	Basic data types, structures, unions, enumerations, array variables
			Specifying	You can use member offsets to place structure members at any memory locations. ³
		Unions	Function	A derivative data type that groups together data with different variable types.
			Member data	Number of members: 4 max. BOOL, BYTE, WORD, DWORD and LWORD.
		Enumerations	types Function	A derivative data type that uses taxt strings called anymerators to everyone variable values
	Data tura	Enumerations	Function	A derivative data type that uses text strings called enumerators to express variable values.
	Data type attributes	Array specifications	Function	An array is a group of elements with the same data type. You specify the number (subscript) of the element from the first element to specify the element. Number of dimensions: 3 max.
			Array specifications for FB instances	Supported.
		Range specific	ations	You can specify a range for a data type in advance. The data type can take only values that are in the specified range.
		Libraries		User libraries.
Motion control	Control modes			Position control, velocity control, torque control
	Axis types			Servo axes, virtual servo axes, encoder axes and virtual encoder axes
	Positions that c	an be managed		Command positions and actual positions
	Single-axis	Single-axis	Absolute	Positioning is performed for a target position that is specified with an absolute value.
	-	position	positioning	
		contol	Relative positioning	Positioning is performed for a specified travel distance from the command current position.
			Interrupt	Positioning is performed for a specified travel distance from the position where an interrupt
			Cyclic synchro-	The function which output command positions in every control period in the position control
			nous absolute positioning	mode.
		Single-axis	Velocity control	Velocity control is performed in position control mode.
		velocity control	Cyclic synchronous velocity control	A velocity command is output each control period in the velocity control mode.
		Single-axis	Torque control	The torque of the motor is controlled.
		Single-axis	Starting cam	A cam motion is performed using the specified cam table.
		control	Ending cam	The cam motion for the axis that is specified with the input parameter is ended.
			Starting gear	A gear motion with the specified gear ratio is performed between a master axis and slave axis.
			Positioning gear	A gear motion with the specified gear ratio and sync position is performed between a master
			Ending gear	The specified gear motion or positioning gear motion is ended.
			operation Synchronous	Positioning is performed in sync with a specified master axis.
			positioning Master axis	The phase of a master axis in synchronized control is shifted
			phase shift	
			axes	ormand positions of two axes are added or subtracted and the result is output as the command position.
		Single-axis manual	Powering the servo	The servo in the servo drive is turned ON to enable axis motion.
		operation	Jogging	An axis is jogged at a specified target velocity.

Item			NX7 CPU Unit			
Motion control	Single-axis	Auxiliary functions for	Resetting axis errors	Axes errors are cleared.		
		single-axis control	Homing	A motor is operated and the limit signals, home proximity signal, and home signal are used to define home.		
			Homing with parameter	Specifying the parameter, a motor is operated and the limit signals, home proximity signal and home signal are used to define home.		
			High-speed homing	Positioning is performed for an absolute target position of 0 to return to home.		
			Stopping	An axis is decelerated to a stop at the specified rate.		
			Immediately stopping	An axis is stopped immediately.		
			Override factors	The target velocity of an axis can be changed.		
			Changing the current position	The command current position or actual current position of an axis can be changed to any position.		
			Enabling external latches	The position of an axis is recorded when a trigger occurs.		
			Disabling external latches	The current latch is disabled.		
			Zone monitoring	You can monitor the command position or actual position of an axis to see when it is within a specified range (zone).		
			Enabling digital cam switches	You can turn a digital output ON and OFF according to the position of an axis.		
			Monitoring axis following error	You can monitor whether the difference between the command positions or actual positions of two specified axes exceeds a threshold value.		
			Resetting the following error	The error between the command current position and actual current position is set to 0.		
			Torque limit	The torque control function of the servo drive can be enabled or disabled and the torque limits can be set to control the output torque.		
			Position compensation	The function which compensate the position for the axis in operation.		
			Start velocity	You can set the initial velocity when axis motion starts.		
	Axes groups	Multi-axes coordinated control	Absolute linear interpolation	Linear interpolation is performed to a specified absolute position.		
			Relative linear interpolation	Linear interpolation is performed to a specified relative position.		
			Circular 2D interpolation	Circular interpolation is performed for two axes.		
			Axes group cyclic synchro- nous absolute positioning	A positioning command is output each control period in Position control mode.		
		Auxiliary functions for	Resetting axes group errors	Axes group errors and axis errors are cleared.		
		multi-axes coordinated	Enabling axes groups	Motion of an axes group is enabled.		
		control	Disabling axes groups	Motion of an axes group is disabled.		
			Stopping axes groups	All axes in interpolated motion are decelerated to a stop.		
			Immediately stopping axes groups	All axes in interpolated motion are stopped immediately.		
			Setting axes group override factors	The blended target velocity is changed during interpolated motion.		
			Reading axes group positions	The command current positions and actual current positions of an axes group can be read.		
			Changing the axes in a group	The composition axes parameter in the axes group parameters can be overwritten temporarily.		
	Common items	Cams	Setting cam table properties	The end point index of the cam table that is specified in the input parameter is changed.		
			Saving cam tables	The cam table that is specified with the input parameter is saved in non-volatile memory in the CPU unit.		
			Generating cam tables	The cam table that is specified with the input parameter is generated from the cam property and cam mode.		
		Parameters	Writing MC settings	Some of the axis parameters or axes group parameters are overwritten temporarily.		
			Changing axis parameters	You can access and change the axis parameters from the user program.		

Item				NX7 CPU Unit
Motion control	Auxiliary	Count modes		You can select either linear mode (finite length) or rotary mode (infinite length).
	functions	Unit conversion	IS	You can set the display unit for each axis according to the machine.
		Acceleration/	Automatic	Jerk is set for the acceleration/deceleration curve for an axis motion or axes group motion.
		deceleration	acceleration/	
		control	deceleration	
			Control Changing the	You can change the appealaration or decoloration rate over during appelaration or decoloration
			acceleration and	Tou can change the acceleration of deceleration rate even during acceleration of deceleration.
			deceleration	
			rates	
		In-position che	ck	You can set an in-position range and in-position check time to confirm when positioning is
	Oten method			completed.
		Stop method	· ··· · · · · · · · · · · · · · · · ·	You can set the stop method to the immediate stop input signal or limit input signal.
		Re-execution of	motion control	You can change the input variables for a motion control instruction during execution and execute the instruction again to change the target values during operation
		Multi-execution	of motion	You can specify when to start execution and how to connect the velocities between operations.
		control instruct	ions (buffer	when another motion control instruction is executed during operation.
		mode)	-	
		Continuous axe	s group motions	You can specify the transition mode for multi-execution of instructions for axes group operation.
		(transition mod	e)	
		Monitoring	Software limits	Software limits are set for each axis.
		Tunctions	Following error	I ne error between the command current value and the actual current value is monitored for an
			Velocity accel-	You can set warning values for each axis and each axes group
			eration/decelera-	
			tion rate, torque,	
			interpolation	
			velocity and	
			acceleration/de-	
			celeration rate	
		Absolute encod	ler support	You can use an OMRON Accurax-G5 series servomotor with an absolute encoder to eliminate
				the need to perform homing at startup.
		Input signal log	ic inversion	You can inverse the logic of immediate stop input signal, positive limit input signal, negative limit input signal or home provimity input signal
	External interfa	co signals		The serve drive input signals listed on below are used
	External interna	ce signais		Home signal, home proximity signal, positive limit signal, negative limit signal, immediate
				stop signal and interrupt input signal.
Unit (I/O)	EtherCAT	Number of slav	es	512 max.
management	slaves			
communica-	Peripheral USB	port		A port for communications with various kinds of support software running on a personal computer
	EtherNet/IP	Communication	protocol	TCP/IP, UDP/IP
	port	CIP communi-	Tag data links	Programless cyclic data exchange is performed with the devices on the EtherNet/IP network.
		cations service	Message	CIP commands are sent to or received from the devices on the EtherNet/IP network.
			communications	
		TCP/IP	Socket services	Data is sent to and received from any node on EtherNet using the UDP or TCP protocol.
		applications	FTP client	File can be read from or written to computers to other Ethernet nodes from the CPI Lunit ETP.
			FIF client	client communications instructions are used.
			FTP server	Files can be read from or written to the SD memory card in the CPU unit from computers at
				other Ethernet nodes.
			Automatic clock	Clock information is read from the NTP server at the specified time or at specified interval after
			adjustment	the power supply to the CPU unit is turned ON. The internal clock time in the CPU unit is
			SNMP agent	Built-in EtherNet/IP port internal status information is provided to network management
			Shine agent	software that uses an SNMP manager.
	EtherCAT port	Supported	Process data	A communication method to exchange control information in cyclic communications between
		services	communications	the EtherCAT master and slaves. This communications method is defined by CoE.
			SDO	A communication method to exchange control information in noncyclic event communications
		No.	communications	between the EtherCAT master and slaves. This communications method is defined by CoE.
		Network scann	ng	Information is read from connected slave devices and the slave configuration is automatically dependent
		DC (distributed	clock)	Time is synchronized by sharing the EtherCAT system time between all EtherCAT devices
				(including the master).
		Packet monitor	ing	The frames that are sent by the master and the frames that are received by the master can be
				saved. The data that is saved can be viewed with WireShark or other applications.
		Enable/disable	settings for	The slaves can be enabled or disabled as communications targets.
		Disconnecting	connecting	Temporarily disconnects a slave from the EtherCAT notwork for maintenance, such as for
		slaves	connecting	replacement of the slave and then connects the slave again.
		Supported	CoE	SDO messages of the CAN application can be sent to slaves via EtherCAT.
		application		- ''
		protocol		
	Communication	is instructions		I NE TOHOWING INSTRUCTIONS ARE SUPPORED:
				structions and FTP client instructions.
Operation	RUN output con	itacts		The output on the power supply unit turns ON in RUN mode.
management	-			

Item				NX7 CPU Unit			
System management	Event logs	Categories		Events are recorded in the following logs: System event log Access event log User-defined event log			
		Number of over	ts par avant lag				
Debugging	Online editing	Number of ever	its per event log	1,024 max. Programs, function blocks, functions and global variables can be changed online. Different on-			
Dobugging	onino ouning			erators can change different POUs across a network.			
	Forced	Forced refreshi	ng	The user can force specific variables to TRUE or FALSE.			
	refreshing	Number of forced variables	For EtherCAT slaves	64 max.			
	MC test Run			Motor operation and wiring can be checked from the Sysmac Studio.			
	Synchronization	Ì		The project file in the Sysmac Studio and the data in the CPU unit can be made the same when online.			
	Differentiation	Differentiation	nonitoring	Rising/falling edge of contacts can be monitored.			
	monitoring	Number of cont	acts	8 max.			
	Data tracing	Types	Single triggered	When the trigger condition is met, the specified number of samples are taken and then tracing			
			Continuous trace	Data tracing is executed continuously and the trace data is collected by the Sysmac Studio.			
		Number of simu trace	ultaneous data	4 max.			
		Number of reco	rds	10,000 max.			
		Sampling	Number of sam-	192 variables max.			
			pled variables	-			
		Timing of samp	ling	Sampling is performed for the specified task period, at the specified time or when a sampling instruction is executed.			
		i riggered	I riggered traces	I rigger conditions are set to record data before and after an event.			
			conditions	Comparison of non-BOOL variable with a constant. Comparison method: Equals (=), greater than (>), greater than or equals (\geq), less than (<), less than or equals (<), not equal (<)			
			Delay	Trigger position setting: A slider is used to set the percentage of sampling before and after the trigger condition is met.			
	Simulation			The operation of the CPU unit is emulated in the Sysmac Studio.			
Reliability	Self-diagnosis	Controller error levels		Major fault, partial fault, minor fault, observation and information.			
		User-defined	User-defined	User-defined errors are registered in advance and then records are created by executing			
		errors	errors	Instructions.			
Security	Protecting	CPU unit name	s and serial IDs	When going online to a CPU Unit from the Sysmac Studio, the CPU Unit name in the project is			
,	software assets			compared to the name of the CPU Unit being connected to.			
	and preventing operating mistakes	Protection	User program transfer with no restoration information	You can prevent reading data in the CPU unit from the Sysmac Studio.			
			CPU unit write protection	You can prevent writing data to the CPU unit from the Sysmac Studio or SD memory card.			
			Overall project file protection	You can use passwords to protect .smc files from unauthorized opening on the Sysmac Studio.			
		Manification	Data protection	You can use passwords to protect POUs on the Sysmac Studio.			
		operation authority	operation authority	juries that may be caused by operation rights to prevent damage to equipment or in-			
		-	Number of groups	5			
	-	Verification of user program execution ID		The user program cannot be executed without entering a user program execution ID from the Sysmac Studio for the specific hardware (CPU unit).			
SD memory	Storage type	A		SD memory card, SDHC memory card			
caru	Application	Automatic trans	ster from SD	I ne data in the autoload tolder on an SD memory card is automatically loaded when the power supply to the controller is turned ON			
		SD memory car instructions	d operation	You can access SD memory cards from instructions in the user program.			
		File operations Studio	from the Sysmac	You can perform file operations for Controller files in the SD memory card and read/write standard document files on the computer.			
		SD memory car	d life expiration	Notification of the expiration of the life of the SD memory card is provided in a system-defined			
Backup	SD momory	detection		variable and event log. Vou can use front switch to backup, compare or restore date			
Баскир	card backup functions	Operation	switch Using system-	You can use system-defined variables to backup or compare data.			
			defined variable				
			Memory card operations dialog box	Backup and verification operations can be performed from the SD memory card operations di- alog box on the Sysmac Studio.			
			Using instruction	Backup operation can be performed by using instruction.			
		Protection	Backing up data to the SD memory card	Prohibit SD memory card backup functions.			
	Sysmac Studio	controller backu	p functions	Backup, restore and verification operations for units can be performed from the Sysmac Studio.			

 $^{\rm *1}\,$ Inline ST is supported (Inline ST is ST that is written as an element in a ladder diagram).

Nomenclature

NX7 CPU unit

100 to 240 VAC power supply unit (NX-PA9001)

24 VDC power supply unit (NX-PD7001)

Dimensions

Power supply unit (NX-PA9001/PD7001)

Note: 1. This dimension depends on the selected power supply unit: - 51 mm: NX-PD7001 - 80 mm: NX-PA9001

NX7 CPU unit

End cover (NX-END01)

Mounting height

Note: 1. This is the dimension from the back of the unit to the communication cables: - 155 mm: When an XS6G-T421-1 connector is used.

2. This dimension depends on the specifications of the commercially available USB cable.

Ordering information

NX7 series system

Power supply units

Symbol	Description	Output capacity	BUN output	Model
Symbol	Description	Total		Model
(1)	100 to 240 VAC power supply unit for NX7 CPU	90 W	Supported	NX-PA9001
